

Estimated Books Sold per Day

What it shows

Estimated number of copies sold each day over the past 30 days.

Each bar represents a single calendar day.

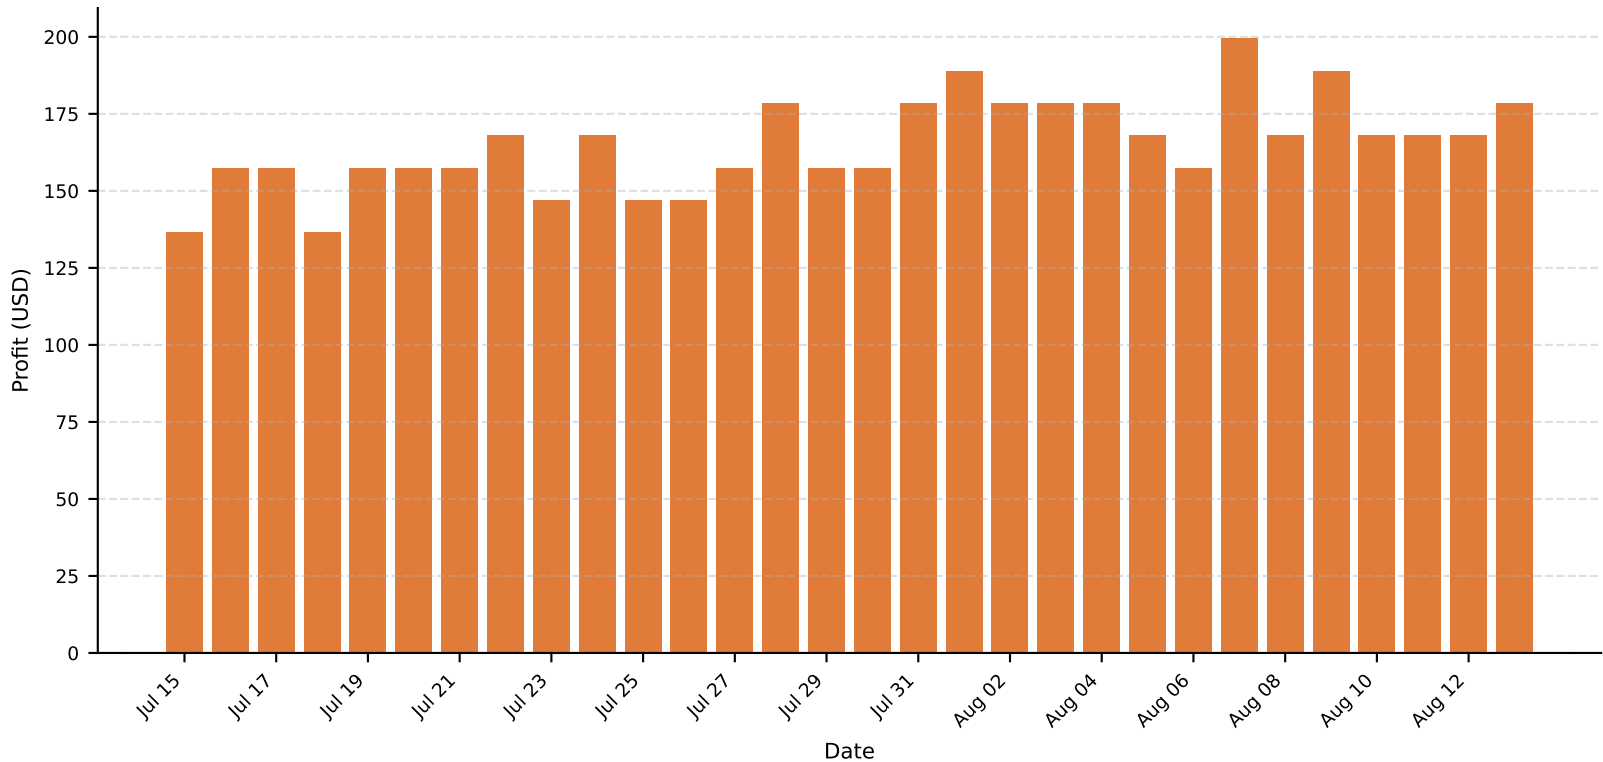

Spikes typically correspond to promotions, ads, or organic ranking improvements.

Data source & formula

```
estimated_units = round( 10,000 / BSR^0.70 )  
                (standard Amazon BSR-to-sales power-law approximation)
```

BSR is scraped daily from the Amazon product page.

Estimated Daily Profit (USD)

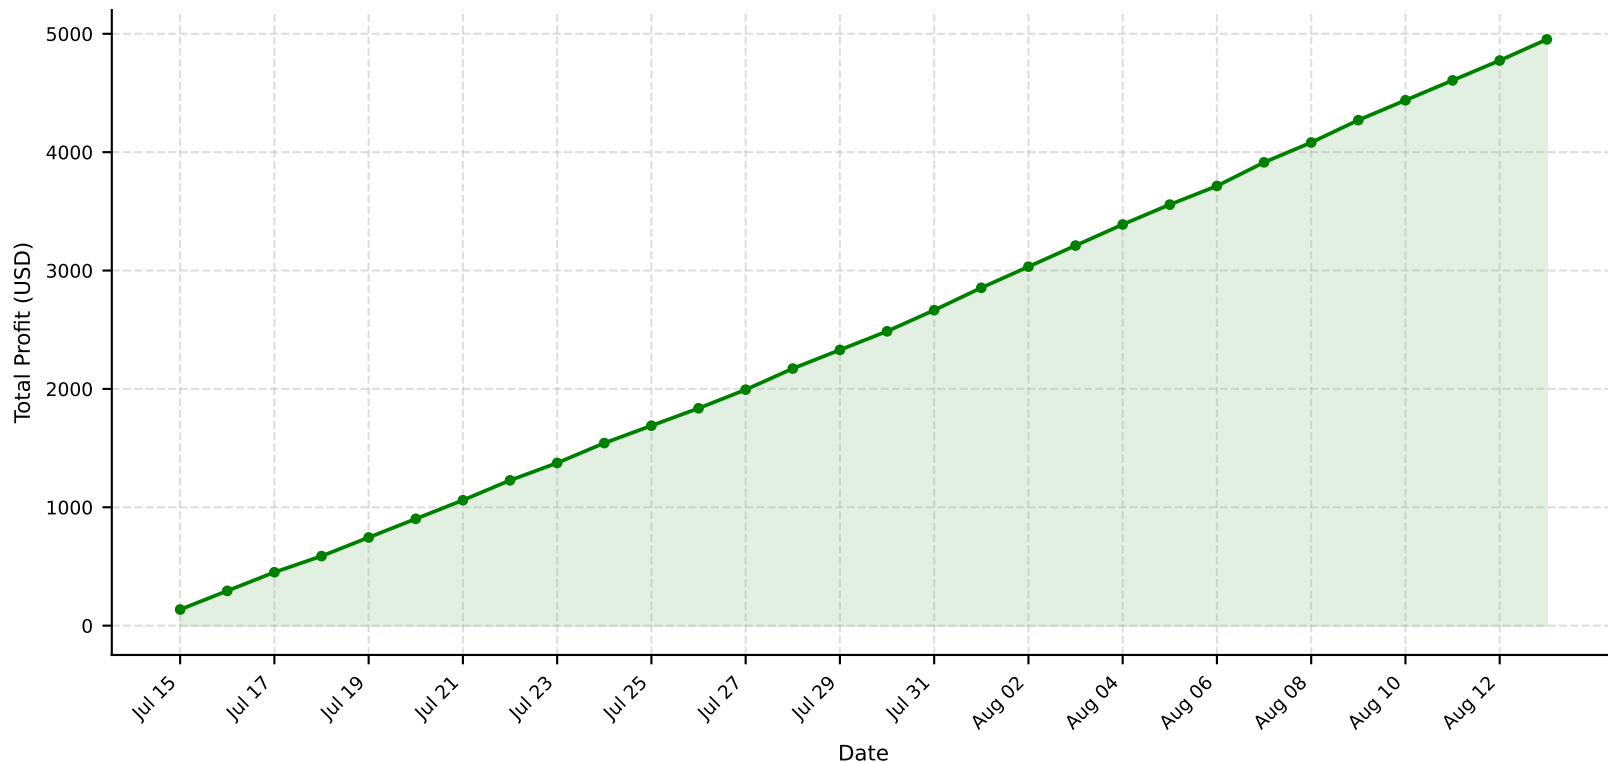

What it shows

Estimated gross royalty profit earned each day, derived from the daily BSR.
Useful for identifying high-revenue days and correlating them with marketing activity.

Data source & formula

```
estimated_units = round( 10,000 / BSR^0.70 )  
                (standard Amazon BSR-to-sales power-law approximation)  
daily_profit    = estimated_units × $14.99 × 70%  
Price and royalty % are entered by the user in the tracker dashboard.
```

Cumulative Estimated Profit (USD)

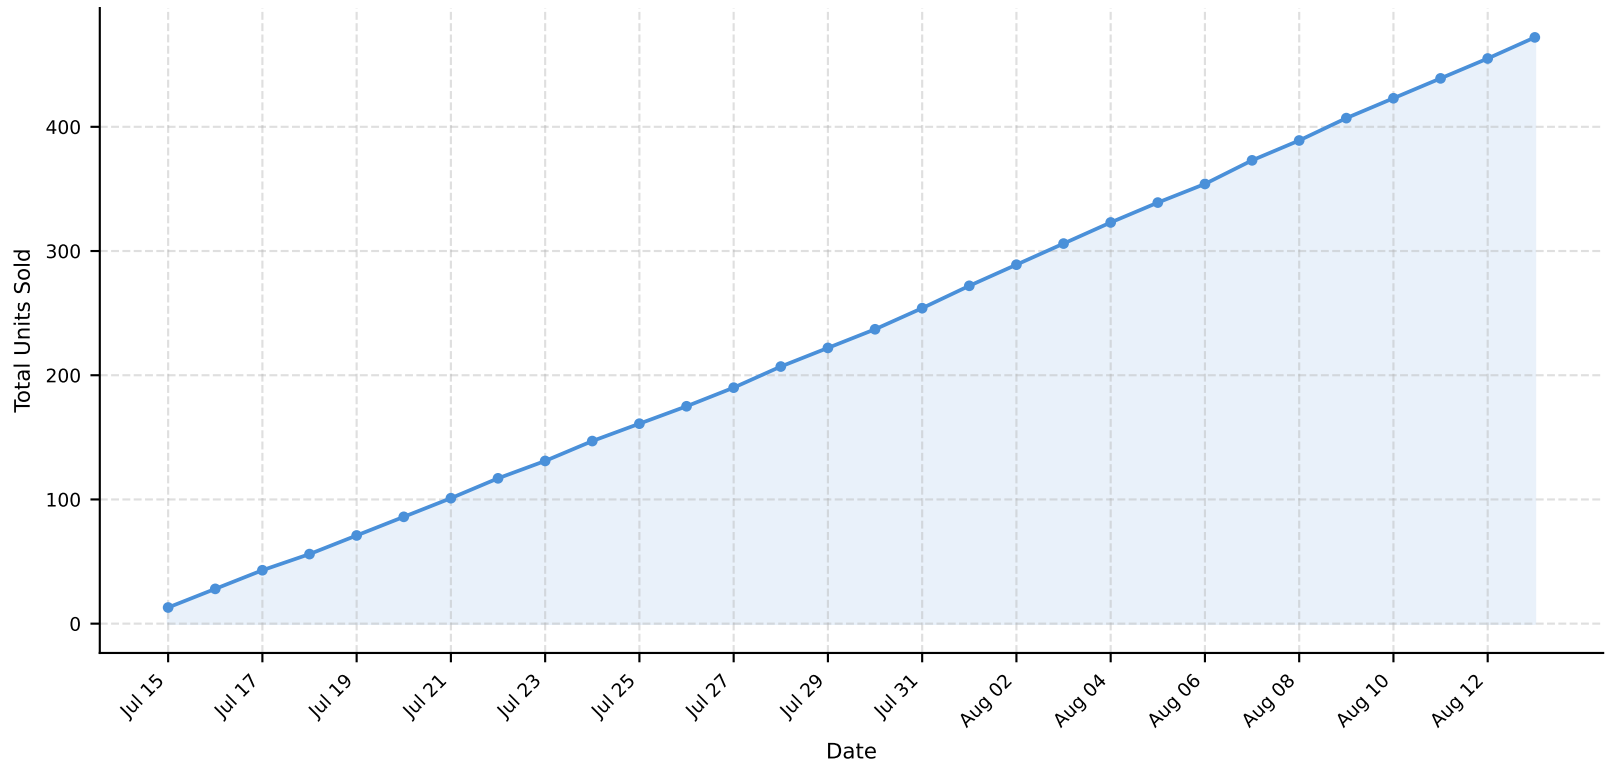

What it shows

Running total of estimated profit accumulated day by day over the 30-day window.
Use this to track whether the monthly revenue target is on pace.

Data source & formula

```
cumulative_profit[i] = Σ daily_profit[0 ... i]
                    = Σ ( estimated_units[j] × price × royalty_pct ) for j in 0...i
```

Cumulative Estimated Books Sold

What it shows

Running total of estimated copies sold from day 1 through the current day.
A steadily rising slope indicates sustained organic sales momentum.
Flattening segments mark low-BSR (high-rank) days with few sales.

Data source & formula

```
cumulative_units[i] =  $\sum$  estimated_units[0 ... i]  
estimated_units[j] = round( 10,000 / BSR[j]^0.70 )
```

Monthly Profit Summary

Month	Est. Units Sold	Total Profit	Avg Daily Profit	Days
February 2026	443	\$4,648.40	\$166.01	28
March 2026	560	\$5,876.08	\$189.55	31
April 2026	463	\$4,858.26	\$161.94	30
May 2026	494	\$5,183.54	\$167.21	31
June 2026	494	\$5,183.54	\$172.78	30
July 2026	501	\$5,256.99	\$169.58	31
August 2026	209	\$2,193.04	\$168.70	13

What it shows

Aggregated estimated profit and unit figures grouped by calendar month, covering the past 6 months up to today.
The current (partial) month reflects only the days elapsed so far.

Data source & formula

BSR scraped daily → estimated_units → profit per day → summed by month
Avg Daily Profit = Total Monthly Profit ÷ days with data in that month
Price: \$14.99 | Royalty: 70% (user-configured)
